

Theory Questions

Express.js & APIs

1. What is an API?

An API is a way for different application to communicate with each other. It allows one application to send requests and receive data from another application.

2. What is Routing in Express.js?

Routing in Express.js is the process of defining different urls and deciding what response the server should send when a user visits those urls or makes a request.

3. What is the difference between GET and POST requests?

A get request is used to retrieve data from the server. A post request is used to send new data to the server, such as creating a new user or submitting a form.

MongoDB & Mongoose

4. What is MongoDB?

MongoDB is a Nosql database that stores data in flexible, json-like documents instead of tables. It is fast and works well with modern web applications.

5. What is Mongoose?

Mongoose is a library for Node.js that makes it easier to work with MongoDB. It provides a simple way to create models and manage data.

6. Why do we use Mongoose in a Node.js application?

We use Mongoose because it makes working with MongoDB easier. It helps us define data structure, validate data, and perform database operations with simple methods.

JWT Authentication

7. What is JWT?

JWT means jsonWeb Token ,It is a secure token used to verify the identity of a user after they log in. It stores user information in an encoded format.

8. Why is JWT used in web applications?

JWT is used to authenticate users and protect their accounts. It allows users to stay logged in securely without sending their login details with every request.

9. What is a Protected Route?

A Protected Route is a route that only authenticated users can access. If a user does not have a valid token or permission, they cannot use that route.
